

Raised garden bed

Nearly every plant can be planted in raised beds. The growing process is supported by heat inside.

Inside a raised garden bed organic material is rotting which is responsible for the heat. This heat speeds up the growing process. Tomatoes and other sun-loving plants such as cucumbers or cabbage are the most popular plants to grow in a raised bed. These vegetables count to the stronger type of plants, which should be cultivated in the first one or two years. Weaker plants like salad should be planted in the following years. In the end every plant can be planted in a raised bed. Raised garden beds can be planted more extensively because vegetables like cucumbers grow their branches over the edges, this means that they need less space. Strawberries are also well known as a raised garden bed plant. The soil should be replaced every year or at least filled up.

Strawberries:

Best fitted for raised garden beds are strawberries which climb or fall over the edges. Those types are less sun sensitive as the wood strawberry. That's the most important thing because raised garden beds are obviously raised.

The strawberry is one of the most common summer fruit and grows best in moist soil with a high organic substance.
